After I installed it (as an update from .NET Framework) everything went smooth until 2 days later it crashed the whole system. Almost a week of trying different things to fix it and it turns out that no one has ever solved it. It says: "this application requires .NET Framework 2.0, which is not installed." So I had no other choice than to uninstall the program (will never install this one again), but after I uninstalled it, my whole system was slower than before I installed the update! And here, for the ones who like to download their programs without any trouble, the Microsoft website gives some explanations: Overview WTF! has a new name, (WTF stands for Windows Themes Framework). It is a new .NET Framework component that implements the IThemeFramework interface, and provides a framework to easily create new themes. WTF is a part of the .NET Framework 3.5. To install, simply install the .NET Framework. WTF! is included with all versions of the .NET Framework 3.5 and 4.0. Dependencies WTF! uses the Windows Visual 81e310abf
