MultiWave is a GUI based application designed to automate the process of transforming several mono PCM wave files (for example, stereo and 5.1 surround files) into a multichannel PCM wave file. Here are the supported file formats: common formats: WAV, WAV 2.0, AVI, AVI 2.0, VOB, MPEG video and MP3 DJ formats: MP3, MP3 L1 (low quality), MP3 L2 (average quality), WMA (both standard and high quality), WMA Lossless, AAC (both standard and high quality) native formats: AC3, DTS format you could use:WAVE_FORMAT_EXTENSIBLE You can easily choose the master channel to which is to be assigned each audio channel. At the end, you can create a single multichannel wave file. Several options are available: Automatic: automatically assign the wave files to the channels; simply select the wave files with the right mouse button and select the required channel. General: select the output file. Loudness: increase or decrease the level of the output file. Speed: set the number of seconds of playback of each file per second. Select wave files: select the wave files from your computer. Supported files: select the required file types from the list. With MultiWave you can also: Trim sound files: you can trim an audio file in order to remove part of the audio data and increase the speed. Padding sound files: you can use silence to fill in spaces not containing any sound. Convert to PCM: if your sound card uses I2S (I have not tested it, it is for sure the default sound interface for Windows and Linux). Limitations: You can only use as many wave files as the total number of channels you wish to copy. Therefore, if you want to copy 5.1 surround sound you have to select 5.1 surround. The maximum number of wave files depends on the format of the final output. If this number is not enough, the application will ask you for more, a maximum number of files are stored internally. What's New in the MultiWave?

MultiWave is a simple but powerful utility for creating multichannel wave files from mono files. The mapping between the channels and the speakers on which they should play is defined by the WAVE_FORMAT_EXTENSIBLE format tag. MultiWave is easy to use. Simply select the.wav files, and choose the number of channels (up to 7): WAV files with the same suffix are automatically selected for the channels. If you want to select a different wave file for every channel, you need to save the "configuration". The file is saved in a file that you will name when you choose the Save Configuration option: WAV files with different suffixes are stored in the Multichannel directory, so you can store it in a specific sub-directory. To create your wave file with all the selected mono.wav files, simply select "Generate Multichannel WAV file". Before generating your multichannel.wav file, MultiWave automatically generates the command that builds the command line. The details of how to build a command line for your multichannel configuration are given in the help file, but in a few simple steps you can make your computer play from 5.1 surround to 7.1 surround, or from 2.1 surround to 7.1 surround. _____Eddy M. "Once when I was small, I spoke as a child. Now that I am grown, I do as a man." - EPIC OF ALICE This version is optimized for Windows, but I have also created an installer for Mac OS X 10.5. Important : you will also need to download and install the file library libogg for your computer, which is a dependency of this application. This application is not specific to the Lame library, but it uses several of its feature. This is a trial version, but you can buy a full version of the application, which gives you more features for $ 19. Available on the download page Installation and runningMultiWave is very simple: 1. Unzip the file. 2. Start the application. The first window will allow you to select the input and output files (Riff or WAV), and configure the settings. This window contains an interface that is a bit old-fashioned and not all options are visible, but the results can be used. 3. A new tab is displayed, showing the first step of the conversion
