Here's the thing: I'm a writer, and that means I have a metric crapton of files with me at all times, from articles I'm writing to research I need to do. Tons and tons of printouts, whether something I created or something I'm reading. As we all know, your computer's hard drive and RAM (memory) go through periods of need, and a lot of this happens when you're working. It's painstaking to go through that lot of stuff to get what I need, and I don't have time for that. Every system includes a software suite that does it for you, either a photo-editing or art software. Over the course of one hour, I'm going to test your favorite photo editing software, the latest Photoshop. I'll compare the software on features, its abilities, and usability. I'll look at how much fun and how long it takes to do obvious edits on a complicated image. And who knows, I might even do an in-depth Education App Hall of Fame-style review. The first on my list is Photoshop. Photoshop is by far and away the most popular photo-editing software on the planet, so I might as well start with the ubiquitous king of the software world. The software makes it easy to modify the tonal

range of an image; turn incremental adjustments into simple tools; apply presets and save your work for later. If you love to use masks on your photo, Photoshop lets you mask everything from 50% to 100% opacity. The application is also outstanding at doing combination images. I hate when people blur the background of an image. As someone who intentionally wants the background out of a photo, I have to train myself to do that by isolating it, but even then I end up looking at the image and not the painted blur. Photoshop does it automatically when it is asked to combine a subject with the background. Photos that I want to have processed ahead of time, I usually crop out the world.

These tools and techniques offer a range of editing settings that you can use to make the most of your photos ... or to fix the ones that aren't quite there. It may help to think of Lightroom as a gateway to the broader Photoshop world. If you use Lightroom to apply imperfections fixes and other common flaws, you may be able to use regular Photoshop to dramatically improve the quality of your photos (or remove your flaws for good). This also works in reverse: Your regular Photoshop edits may help repair some of the imperfections or colors in your photos that were corrected by Lightroom. With blending, you can choose from over a dozen different options and change the color, intensity, and placement of different parts of an image to achieve the look you want. You can also create your own unique blends such as: There are a number of filters you can use that can create amazing effects. That, of course, depends on the kind of effect you're looking for. With filters, you can blur areas, soften edges, create halos, sharpen edges, and more. Here's a look at a few filters you can use and what they can do. There are a lot more out there, though. Check them here : For a great introduction to built-in actions, you can try Photoshop's preset effects and actions. With this option, you practically don't need to do anything except click on the preset effects. There are three basic types of effects: Photoshop has many many more built-in actions than filters. The power they can use, the magical results they can produce, and the fun they can

bring to your workflow—and of course, their usefulness—makes them worth the investment. If you're new to Photoshop, start with the basics to see if you like the process or not. 933d7f57e6

Background – the background is the theme for the post; it is a color that defines mood and adds tone to the article. It is important to choose the appropriate background to create a well-balanced and cohesive web post. A black or white background is great for posts that are informational or simple writing. A solid color background can be used for more engaging copy. While white and neutral backgrounds effectively break up text and graphics, blue and green backgrounds tend to create a more calming and relaxing aesthetic. Bold – bold text is used to immediately distinguish particular words or phrases from their surroundings. Consequently, bold text helps to make a text more interesting and makes it more visually appealing among other text styles. But don't overdo it; otherwise you risk losing the visual hierarchy in your text. Light – what is the definition of white? Its the lightest color—it is the opposite of black. It is the right color for a white background, because it has a really bright appearance, as if it was exposed to direct sunlight. But a light background makes it difficult to read text, especially if the text is light in color. As a solution to this problem, you can lower the brightness of the text, or use other text styles like a grayscale image or a single color. But keep in mind that this method requires text to be copied to another stage before applying the change. Eye-Catching – Powerful but not always easy to master, the eye is one of the most important and perhaps the most critical aspects of design. It is used to distinguish the main idea of the blog post from the rest of the text. It is often used to highlight headlines or the most important text. It's also used to identify a product or a product line, such as in social media.
